00000

Why use Xdebug

Common Approach

```
var_dump($thing);
// or
print_r($data);
// or
error_log(print_r($someArray, true));
// or
echo __METHOD__ . '' . __LINE__;
```

00000

Common Approach

```
var_dump($thing);
// or
print_r($data);
// or
error_log(print_r($someArray, true));
// or
echo __METHOD__ . '' . __LINE__;
```

Remove that again

don't commit these lines into VCS

- insert outputs
- 2 reload page
- 3 look for output
- 4 change some code

Traditional Way

Introduction

- insert outputs
- 2 reload page
- 3 look for output
- 4 change some code
- 5 repeat 1. until error is fixed

- insert outputs
- reload page
- 3 look for output
- 4 change some code
- 5 repeat 1. until error is fixed
- 6 clean up outputs
- 7 load final version of the page

Xdebug Way

Introduction

00000

1 add breakpoints

1 add breakpoints

Installation

2 reload page

- 1 add breakpoints
- 2 reload page
- 3 step into the code

Advantages

Introduction

00000

■ Faster development time

Advantages

Introduction

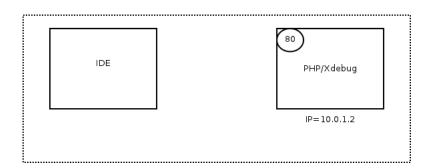

- Faster development time
- Better understanding of what the code is doing

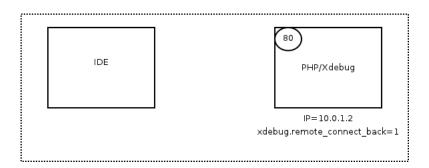

- Faster development time
- Better understanding of what the code is doing
- Does not require code changes

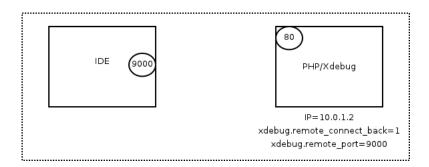

Introduction

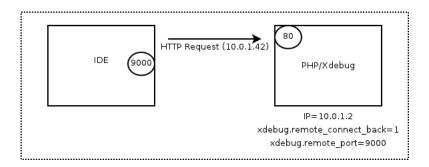

Introduction

Client

Browser extensions

- Xdebug Helper for Firefox
- Xdebug Helper for Chrome
- Xdebug Toggler for Safari
- Xdebug launcher for Opera

Browser extensions

Xdebug Helper for Firefox

Installation

- Xdebug Helper for Chrome
- Xdebug Toggler for Safari
- Xdebug launcher for Opera

or

- HTTP GET/POST variable XDEBUG SESSION START
- Set a Cookie in the header XDEBUG SESSION

Client

VS Code launch.json

Install Extension: PHP Debug

Client

VS Code launch.json

Install Extension: PHP Debug

VS Code launch.json

```
Install Extension: PHP Debug
    "name": "Listen for XDebug".
    "tvpe": "php",
    "request": "launch",
    "port": 9000,
    "pathMappings": {
        "/var/www/html": "${workspaceRoot}"
```

VS Code launch.json

```
This will be automatically generated

{
    "name": "Launch currently open script",
    "type": "php",
    "request": "launch",
    "program": "${file}",
    "cwd": "${fileDirname}",
    "port": 9000
}
```

References

Installation on Ubuntu with PHP-FPM and Nginx

1 apt-get install php-xdebug

- 1 apt-get install php-xdebug
- 2 phpenmod xdebug

- 1 apt-get install php-xdebug
- 2 phpenmod xdebug
- **3** systemctl restart php<u>7.3</u>-fpm

- 1 apt-get install php-xdebug
- 2 phpenmod xdebug
- 3 systemctl restart php7.3-fpm

Check your Target

Install on your target machine, e.g. Vagrant or Docker container. Check the installation with php -m | grep xdebug.

1 apt-get install php-xdebug

Installation

- 2 phpenmod xdebug
- 3 systemctl restart php7.3-fpm

Check your Target

Install on your target machine, e.g. Vagrant or Docker container. Check the installation with php -m | grep xdebug.

Common Pitfall

Check your PHP version with php -v or with <?php phpinfo();

PHP settings / Remote Debugging

```
zend_extension = xdebug.so
xdebug.remote_enable = On
xdebug.remote_connect_back = On
; xdebug.remote_host = 10.0.49.1
```

/etc/php/7.3/mods-available/xdebug.ini

These values are already present in Ubuntu. No need to edit! Make sure you enabled the plugin with phpenmod.

Server

PHP settings / Remote Debugging

```
zend_extension = xdebug.so
xdebug.remote_enable = On
xdebug.remote_connect_back = On
; xdebug.remote host = 10.0.49.1
```

/etc/php/7.3/mods-available/xdebug.ini

These values are already present in Ubuntu. No need to edit! Make sure you enabled the plugin with phpenmod.

Tailored Installation Instructions for install from source

https://xdebug.org/wizard.php

Profiler

What does it do?

Xdebugs Profiler is a powerful tool that gives you the ability to analyze your PHP code and determine bottlenecks or generally see which parts of your code are slow and could use a speed boost.

Profiler

What does it do?

Xdebugs Profiler is a powerful tool that gives you the ability to analyze your PHP code and determine bottlenecks or generally see which parts of your code are slow and could use a speed boost.

- analyzes program execution to measure:
 - memory
 - duration
 - frequency of function calls
- generates files for external analysis (cache grind)

What does it do?

Xdebugs Profiler is a powerful tool that gives you the ability to analyze your PHP code and determine bottlenecks or generally see which parts of your code are slow and could use a speed boost.

- analyzes program execution to measure:
 - memory
 - duration
 - frequency of function calls
- generates files for external analysis (cache grind)

Alternatives: XHprof and Blackfire

Cachegrind Analysis Tools

Output Files: cachegrind.out.%p

- Output Files: cachegrind.out.%p
- Analysis Tools
 - KCacheGrind (Linux)
 - QCacheGrind (Linux, Mac)
 - WinCacheGrind (Windows)
 - Webgrind (web-based)

Enable Profiler

```
# append this to xdebug.ini
xdebug.profiler_enable_trigger = On
xdebug.profiler_output_dir = /tmp/
# don't do this
; xdebug.profiler_enable
```

Enable Profiler

```
# append this to xdebug.ini
xdebug.profiler_enable_trigger = On
xdebug.profiler_output_dir = /tmp/

# don't do this
; xdebug.profiler_enable

systemctl restart php7.3-fpm
```

Profiler Tracer

Configuration

Enable Profiler

```
# append this to xdebug.ini
xdebug.profiler_enable_trigger = On
xdebug.profiler_output_dir = /tmp/
# don't do this
; xdebug.profiler_enable
systemctl restart php7.3-fpm
or
```

- Set HTTP GET/POST variable XDEBUG_PROFILE
- Set a Cookie in the header XDEBUG_PROFILE

What does it do?

Those so-called *function traces* can be a help for when you are new to an application or when you are trying to figure out what exactly is going on when your application is running. The function traces can optionally also show the values of variables passed to the functions and methods, and also return values.
